Como restaurar backup iphone no android

There is no single Android viewing. Of course, we have Material Design, and that's great. But Android can and often look like anyone under the sun: beautiful, nasty, clean, busy, material, holo, retro, futuristic and sometimes even apple-y. If you can make your phone look like anything, it makes sense that some may want their phone to look like one of cupertino devices. Now make your phone look and behave exactly like an iPhone impossible without a specialized ROM or phone that was designed to look and feel like an iPhone — I think xiaomi, Huawei or several other Chinese manufacturers. But between these apps and a little patience, we can make your new phone behave and feel much more like your old... in a good way. This is an area that throws away many former iPhone users' looms, because the home screen experience can be very different from a simple Apple app and folder grid. While Apple users tend to live in the so-called app drawer, Android users have home screens at the top of the app drawer so that most apps are out of the way and the only thing you want to see is on the home screen. Many startups try to emulate or copy the iPhone, and to be correct that there is a possibility. If you just want all your apps to be on the home screen instead of in the app drawer and 5x4 grid with dock, download a launcher like Hola or iLauncher. Icons won't be the same, and the quick settings won't be there, but you'll get 93 percent of the way back to what you had. Enjoy. Want to try to get closer? Want a quick settings gesture on the home screen or sequential icons or even exact icons that match your old phone? Well, it won't be easy to install and go, but with Nova Launcher and some time, we're going to make magic. Now for those who are new to our small Android clubs, Nova Launcher is a very popular and customizable third-party home screen launcher. It can replace the trigger that was on your phone as the default home screen, so Android users can change their entire home screen experience by downloading a new launcher. They're amazing, and there's a lot of good launchers out there, but today we're sticking with Nova so we can get in and dirty Nova Settings to help us get as close as possible. Create an Home screen layout in Nova Launcher: Install Nova Launcher from the Google Play Store. It's free, although I highly recommend buying Nova Launcher Prime (\$4.99) to get all the features, including gesture links, which we'll then use for quick settings. Open Nova Launcher. Tap the home button. When prompted, select Nova Launcher as the default screen launcher. Open the app drawer (six dots in a circle in the center of the dock). Open Nova Settings, and then click Desktop. Open the desktop grid and expand the grid from 5 up to 6 by dragging the current row number (5) up until 6 takes up the location, and the preview grid displays six rows in the video grid. Confirm the change by tapping Done. (Optional) Scroll down settings, and switch to the Add to home screen icon. Note: Most users hate this setting because everything you install on the home screen instead of in the app drawer. For users coming from iPhones who are accustomed to live in the app drawer, you might want all apps to be thrown to the home screen so that you never look at the app's drawer. Tap the Back button to return to the Nova Settings main menu. Open the dock. Open the dock icons and drag 5 to the right until 4 takes its place and views the dock instead of 5 you will see four squares. This will allow our dock to line up with our desktop grid, but it also means that if you're going to use an app drawer, your dock may feel unbalanced. Download the background of the iOS folder and save it to the folder you'll remember. Open Nova settings, and then the folders. In the folder view, select Gridlines. In the background of the folder, select Custom. Scroll to the background image of the downloaded folder and select it. Tap the home button to return to the home screen and check the new grid. Now your grid will look the way your iPhone did, but the icons won't yet. Apple-esque (and actual Apple) icons for Android icons are much more diverse than rounded squares, which Apple insists that all App Store icons contain. But fortunately, the Google Play Store has a ton of metric icon packages that will give you the icons so formed. None of them are very similar to Apple (because of copyright), but you have many options. Here are just a few. Adrasta (Free) is a rounded square icon pack that looks pretty freaking out well with a bright palette and clean lines. It also has a masking tool so that the generic icons still sit on a round rectangle. It also has a nice variety of alternative icons allowing you to play. Beluk (\$0.99) is a super rounded square icon package that can fit straight with ridiculously pop-off-the-screen colorful themes or more refined, muted wallpapers. Play with your squares once! Ala (\$0.99) takes on a flattering, simpler look in its squares, with a palette and design that plays well with material layouts and appears against a large number of wallpapers. Install the package from Google Play. Open Nova Settings, then look and feel it. Open the icon theme and select an icon pack from the list of icon packages. Press the home button and see your glorious new icons. (Optional) If the icons in the launcher look too small, you can turn off icon size normalization by using Look & Feel to try to increase the size of the icons. If you are a Nova Launcher Prime user, you can increase icons in the desktop, dock, and App & Widget drawer by using each of these menus icon layout. For more information about icon layout and Nova Settings, read our handy guide (cta: large) If you have absolutely, positively you must have icons from your iPhone, you can have them. However, you'll need to set each one you're using as a custom icon. And if it sounds rusty, it's because it is, but it is especially priced. I know, I paid a lot before. Download iOS 9 stock icons from Deviantart user LutschGabriel or iOS 8 icons from deviantart user dtafalonso. You'll now need to extract icons using a File Manager program, such as Solid Explorer. Save them to a handy folder and remember where you saved them, because you'll return a lot to that folder. Press one of the app shortcuts on the home screen for a long time to change. Edit the link. Tap the icon to edit the icon. Instead of selecting an icon from the package, tap Gallery apps. Select Documents to exit the document browser. Find the folder where you saved the stock icons, and then select the iOS icon you want. Make sure that the preview square contains the full icon. If not, drag the corners of the preview box to expand it. Tap Done to confirm the custom icon. (Optional) If you want to reset an app to match its iOS colleague, feel free to do so. Changing the label doesn't change the app you're referring to, so you can lie and say you're going to iMessage when you're really going to hangouts. In the edit links window, tap Done to confirm your changes. Take a drink and repeat steps 1-11 for each icon for which you have an iOS icon. While you're in it, go ahead and unscrew the apps in the desired order on the home screen. So we have our main screen positioned as the iPhone, we have icons that look like the iPhone, now, how about wallpapers that look like the iPhone? Wallpaper Apple has had many distinctive stock wallpapers over the years, and although I will never, ever use stock wallpaper, because this is the main way to make the phone on its own and we offer you five new wallpapers every Wednesday... well, if you want to use one of Apple's coveted stock wallpapers, reddit's got ya covered. There are also various wallpaper apps that will add the parallax effect to the screen to further simulate the iPhone, but most of them just don't deserve time or space on your phone. If you want the wallpaper to move, you can enable scrolling wallpapers in Nova Settings & Desktop & Scroll & Wallpaper Scrolling. Fast settings Honestly, the shade of Quick Settings in stock for Android is quite decent, on some devices it is customized, and in addition, it comes from the top of the screen, not the bottom, they are not terribly different. Thanks to Nova Launcher Prime gestures, you can even set swipe up to expand quick settings. But if you want the Quick Settings panel to look more familiar, well, there's a program for that. Smart Control adds a screen overlay that will bring out a quick settings panel that is extraordinarily Apple-esque and quite responsive. Because it's a screen overlay, it can interfere with gestures and controls in other apps, so remember if you're playing a lot of games or scrolling a lot up from the bottom of the screen. Without it it crashes, and it's a screen overlay, you may have to make it hard to regain the recovery Device. That's why I highly recommend using the Quick Settings panel that comes with your phone. Messages No iMessage for Android. Apple does not care that its amazing messaging system is available to other platforms, it wants you to buy your devices on your awesome messaging system. #SorryNotSorry. Now there are many different SMS text messaging applications with different styles, but I think Textira is getting quite close, and there is still material and installation with the new Android system. Textira allows you to make text bubbles in the same shape as they were in iMessage, and you can make them the same soothing blue — because Apple has caused its users to hate green for some reason. You can even have new notification pop-ups with a quick answer, as you did on your iPhone. If you've been having problems with text messages since you came to Android, here's how to release texts from iMessage iron grip. Lock screen If you want to use Android Pay, you can stop reading now because you can't use a third-party lock screen with Google's contactless payment app. Still want a lock screen that looks like Apple? Ok, the Google Play Store has a breathtaking number of clones, but the HenryOS Passcode Lock Screen has more than a million installs and more than 35,000 reviews, and the customization is a very faithful tribute to Apple's user interface. Calendar Although Google Calendar is pretty good, if you missed the Apple calendar, well, you can get close to a few others. Cal by Any.do, the creators of a popular work program, form a lovely cross-platform calendar with a very similar feel. If it's not your speed, check out your favorite calendar apps for Android. Android.
